Topic- Tracing of Power curve for testing variance of a Normal Population**.**

Problem – A random sample of size 50 is drawn from a normal population with mean 9 and variance σ^2 ,where σ^2 is unknown.Draw the Power curves for testing $H_0 : \sigma^2 = 6$ against

i) $H_1: \sigma^2 > 6$ ii) $H_1: \sigma^2 < 6$ iii) $H_1: \sigma^2 \neq 6$

Assume that, $\alpha = 0.01$

Theory and Calculation-

Using Neyman's pearson fundamental lemma, the critical region is given by-

$$W = \{ \underset{\sim}{x} \; : \frac{L(\underset{\sim}{x}, \theta_1)}{L(\underset{\sim}{x}, \theta_0)} \geq k \}$$

Here, $f(x, \mu, \sigma^2) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}$; $\quad -\infty < x < \infty, \; -\infty < \mu < \infty, \; \sigma > 0$

$$\therefore \; \frac{L(\underset{\sim}{x}, \sigma_1^2)}{L(\underset{\sim}{x}, \sigma_0^2)} = \frac{\prod_{i=1}^{n} f(x_i, \mu \;, \sigma_1^2)}{\prod_{i=1}^{n} f(x_i, \mu \;, \sigma_0^2)} \geq k$$

$$\Rightarrow \frac{\left(\frac{1}{\sigma_1\sqrt{2\pi}}\right)^n e^{-\frac{1}{2\sigma_1^2}\sum_{i1}^{n}(x_i-\mu)^2}}{\left(\frac{1}{\sigma_0\sqrt{2\pi}}\right)^n e^{-\frac{1}{2\sigma_0^2}\sum_{i=1}^{n}(x_i-\mu)^2}} \geq k$$

$$\Rightarrow \left(\frac{\sigma_0}{\sigma_1}\right)^n e^{\frac{1}{2}\sum_{i=1}^{n}(x_i-\mu)^2\left(\frac{1}{\sigma_0^2}-\frac{1}{\sigma_1^2}\right)} \geq k$$

$$\Rightarrow n\log\left(\frac{\sigma_0}{\sigma_1}\right) + \frac{1}{2}\sum_{i=1}^{n}(x_i-\mu)^2\left(\frac{1}{\sigma_0^2}-\frac{1}{\sigma_1^2}\right) \geq \log k$$

$$\Rightarrow \frac{1}{2}\sum_{i=1}^{n}(x_i-\mu)^2\left(\frac{\sigma_1^2-\sigma_0^2}{\sigma_0^2\sigma_1^2}\right) \geq \log k - n\log\left(\frac{\sigma_0}{\sigma_1}\right)$$

$$\Rightarrow \sum_{i=1}^{n}(x_i-\mu)^2\left(\sigma_1^2-\sigma_0^2\right) \geq 2\sigma_0^2\sigma_1^2[\log k - n\log\left(\frac{\sigma_0}{\sigma_1}\right)]$$

$$\Rightarrow \sum_{i=1}^{n}(x_i-\mu)^2\left(\sigma_1^2-\sigma_0^2\right) \geq k' \quad \text{(say)}$$

Where,

$$k' = 2\sigma_0^{\;2}\sigma_1^{\;2}[\log k - n\log\left(\frac{\sigma_0}{\sigma_1}\right)]$$

<u>Case 1:</u>

When $\sigma_1^{\;2} > \sigma_0^{\;2}$, then the C.R. is,

$$W_1 = \{\underset{\sim}{x} : \sum_{i=1}^{n}(x_i - \mu)^2 \geq k_1\}$$

<u>Case 2:</u>

When $\sigma_1^{\;2} < \sigma_0^{\;2}$, then the C.R. is,

$$W_2 = \{\underset{\sim}{x} : \sum_{i=1}^{n}(x_i - \mu)^2 < k_2\}$$

(i) The C.R. for testing $H_0 : \sigma^2 = 6$ against $H_1 : \sigma^2 > 6$ is given by

$$W_1 = \{\underset{\sim}{x} : \sum_{i=1}^{50}(x_i - 9)^2 > k_1\}$$

where k_1 is a constant to be determined such that the size of the C.R. is equal to α ,

i.e., $P(x \in W_1 \mid H_0) = \alpha$

$$\Rightarrow P\{\sum_{i=1}^{50}(x_i - 9)^2 > k_1 \mid H_0\} = .01$$

$$\Rightarrow P\{\frac{\sum_{i=1}^{50}(x_i - 9)^2}{\sigma_0^{\;2}} > \frac{k_1}{\sigma_0^{\;2}}\} = .01$$

$$\Rightarrow P\{\chi_{(n)}{}^2 > \frac{k_1}{\sigma_0{}^2}\} = .01$$

$$\Rightarrow 1 - P\{\chi_{(n)}{}^2 > \frac{k_1}{\sigma_0{}^2}\} = 1 - .01$$

$$\Rightarrow P\{\chi_{(n)}{}^2 < \frac{k_1}{\sigma_0{}^2}\} = .99$$

To find the value of k_1,we use the following R-command :

a = qchisq(0.99,50,0) (0 is the non-centrality parameter)

This gives us the value $\frac{k_1}{\sigma_0{}^2} = 76.15389$

$\therefore k_1 = 76.15389 \times\ \sigma_0{}^2$ =76.15389 $\times$ 6=456.92334

Thus the C.R. is given by,

$$W_1 = \{\underset{\sim}{x} : \sum_{i=1}^{50} (x_i - 9)^2 > 456.92334\}$$

Now, the Power of the test is given by,

Power=1-β

=P{Reject H_0|H_1 is true}

$$= P(x \in W_1 \mid H_1)$$

$$= P\{\sum_{i=1}^{50} (x_i - 9)^2 > 456.92334 \mid H_1\}$$

$$= P\{\frac{\sum_{i=1}^{50} (x_i - 9)^2}{\sigma_1{}^2} > \frac{456.92334}{\sigma_1{}^2}\}$$

$$= P\{\chi_{(n)}{}^2 > \frac{456.92334}{\sigma_1{}^2}\}$$

$$= 1 - P\{\chi_{(n)}{}^2 < \frac{456.92334}{\sigma_1{}^2}\}$$

Where, $P\{\chi_{(n)}{}^2 < \frac{456.92334}{\sigma_1{}^2}\}$ is the distribution function of the chi-square distribution with 'n' d.f.

Now to trace the power curve we consider different trial values of $\sigma_1{}^2 > 6$ and construct the following table using R-Programming.

Programming in R for case 1

```
a = qchisq(0.99,50,0)

a

var = 6

k1 = var*a

k1

sigma1 =
c(6.3,6.4,6.5,6.6,6.7,6.8,6.9,7.0,7.1,7.2,7.3,7.4,7.5,7.6,7.7,7.8,7.9,8.0,8.1,8.2,8.3,8.4,8.5,8.6,8.7,8.8,8.9,9.0,9.1,9.2)

sigma11 = k1/sigma1

power = mat.or.vec(30,1)

power1 = mat.or.vec(30,1)

for(i in 1:30){

power[i] = pchisq(sigma11[i],50,0)
```

```
power1[i] = 1-power[i]}

power1

plot(sigma1,power1)
```

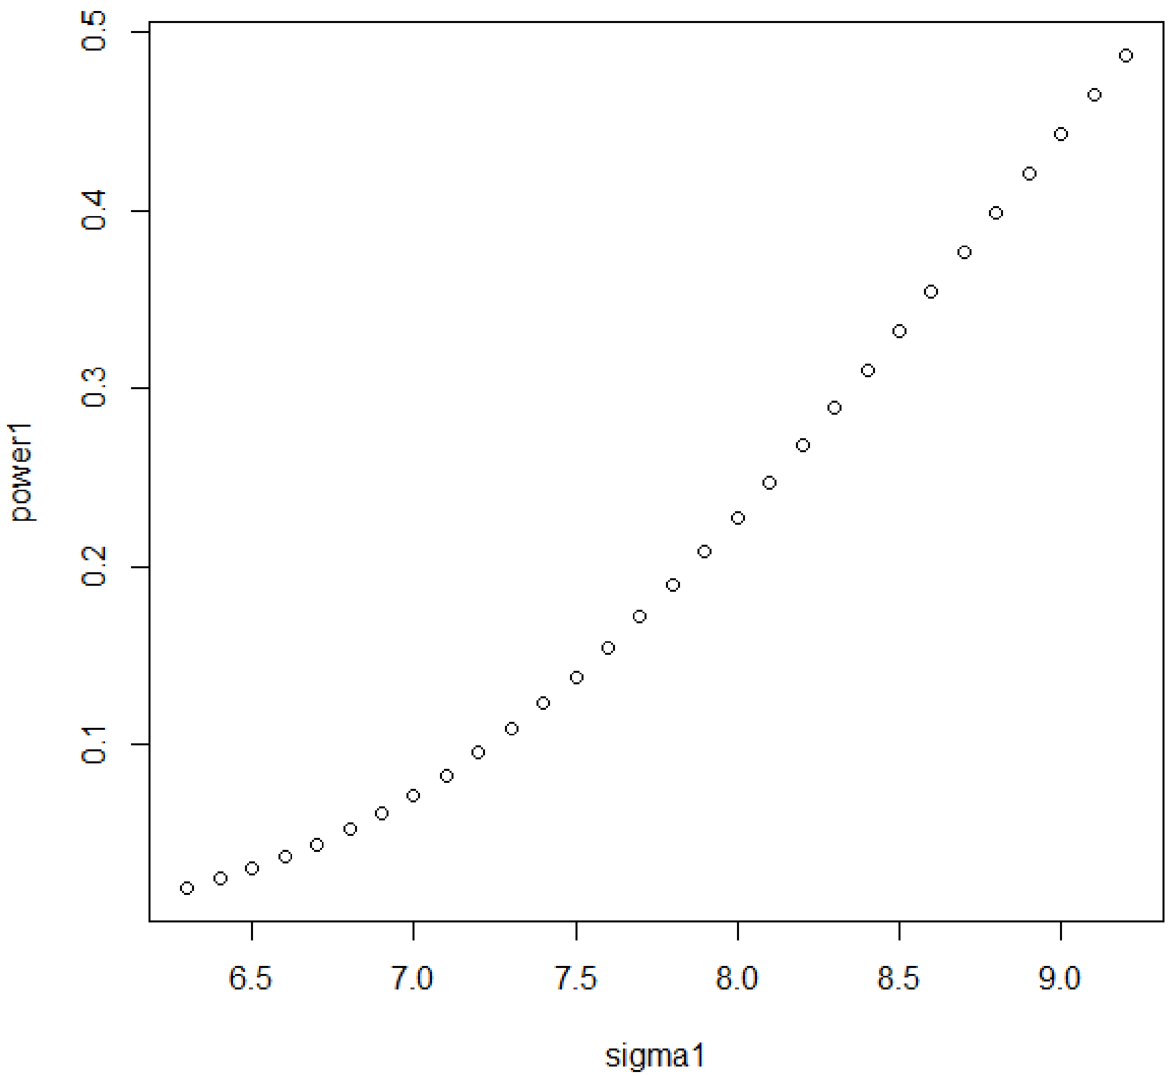
Power curve for case 1



(ii) The C.R. for testing $H_0 : \sigma^2 = 6$ against $H_1 : \sigma^2 < 6$ is given by

$$W_2 = \{\underset{\sim}{x} : \sum_{i=1}^{50} (x_i - 9)^2 < k_2\}$$

where k_2 is a constant to be determined such that the size of the C.R. is equal to α ,

i.e., $P(x \in W_2 \mid H_0) = \alpha$

$$\Rightarrow P\{\sum_{i=1}^{50} (x_i - 9)^2 < k_2 \mid H_0\} = .01$$

$$\Rightarrow P\{\frac{\sum_{i=1}^{50} (x_i - 9)^2}{\sigma_0{}^2} < \frac{k_2}{\sigma_0{}^2}\} = .01$$

$$\Rightarrow P\{\chi_{(n)}{}^2 < \frac{k_2}{\sigma_0{}^2}\} = .01$$

To find the value of k_2,we use the following R-command :

a = qchisq(0.01,50,0) (0 is the non-centrality parameter)

This gives us the value $\frac{k_2}{\sigma_0{}^2} =$ 29.70668

$$\therefore k_2 = 29.70668 \times \sigma_0{}^2 = 2.70668 \times 6 = 178.24008$$

Thus the C.R. is given by,

$$W_2 = \{\underset{\sim}{x} : \sum_{i=1}^{50} (x_i - 9)^2 < 178.24008\}$$

Now, the Power of the test is given by,

Power=1-β

=P{Reject $H_0|H_1$ is true}

$$= P(x \in W_2 \mid H_1)$$

$$= P\{\sum_{i=1}^{50}(x_i - 9)^2 < 178.24008 \mid H_1\}$$

$$= P\{\frac{\sum_{i=1}^{50}(x_i - 9)^2}{\sigma_1^{\ 2}} < \frac{178.24008}{\sigma_1^{\ 2}}\}$$

$$= P\{\chi_{(n)}^{\ 2} < \frac{178.24008}{\sigma_1^{\ 2}}\}$$

Where, $P\{\chi_{(n)}^{\ 2} < \frac{178.24008}{\sigma_1^{\ 2}}\}$ is the distribution function of the chi-square distribution with ‘n’ d.f.

Now to trace the power curve we consider different trial values of $\sigma_1^{\ 2} < 6$ and construct the following table using R-Programming.

Programming in R for case 2

```
a = qchisq(0.01,50,0)

a

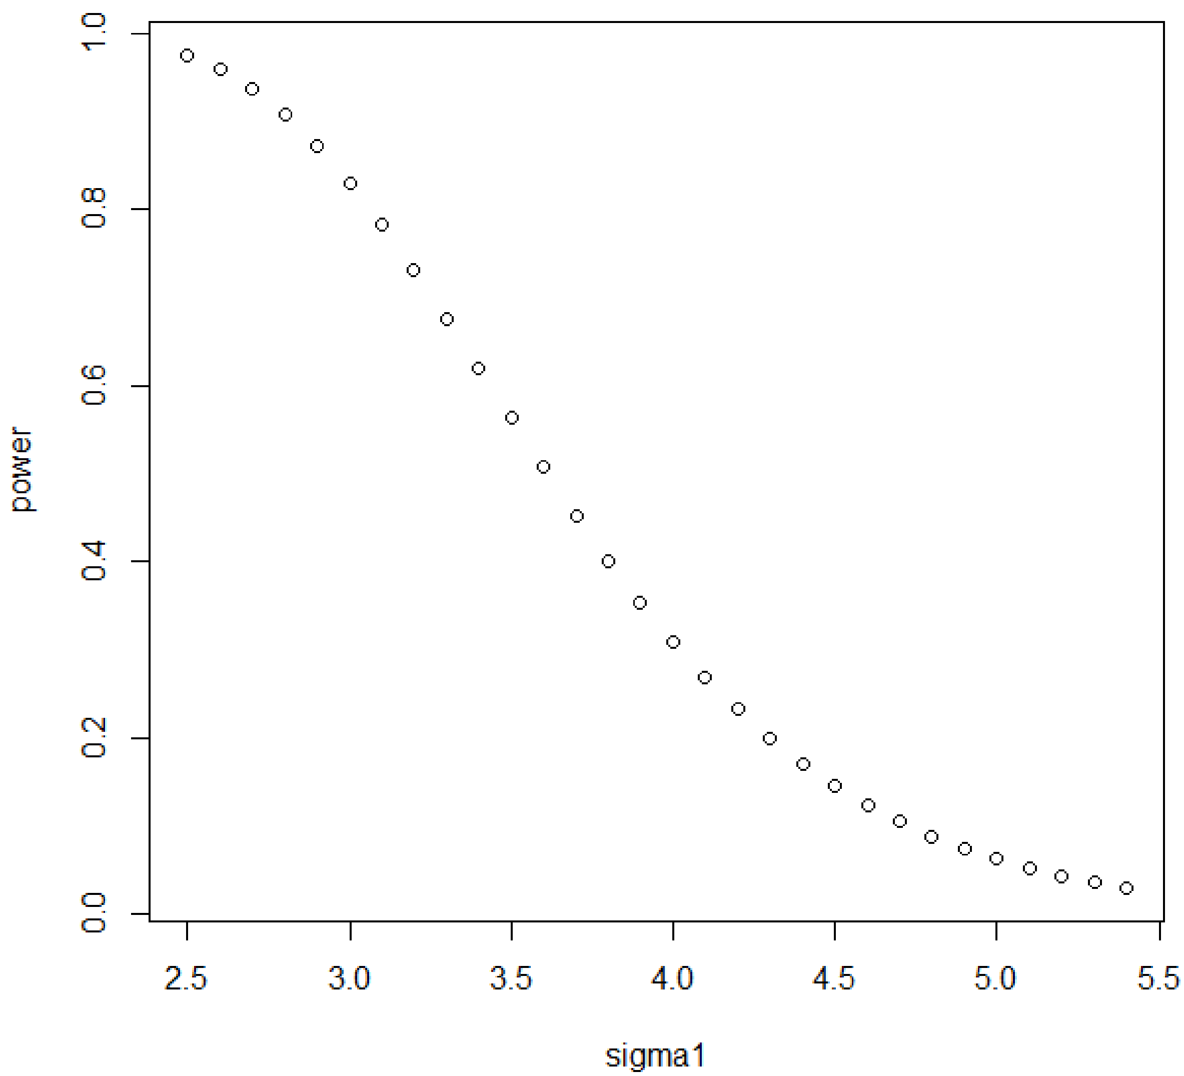
Power curve for case 2



(iii) The C.R. for testing $H_0 : \sigma^2 = 6$ against $H_1 : \sigma^2 \neq 6$ is given by

W$_3$={ $\underset{\sim}{x} : \sum_{i=1}^{50}(x_i - 9)^2$ <k$_3$ or $\sum_{i=1}^{50}(x_i - 9)^2 >$ k$_4$ }

where k$_3$ and k$_4$ are constants to be determined such that,

$$P(x \in W_3 \mid H_0) = \alpha$$

$\Rightarrow P\{\sum_{i=1}^{50}(x_i - 9)^2$ <k$_3$ or $\sum_{i=1}^{50}(x_i - 9)^2 >$ k$_4$ |H$_0$}=.01

$$\Rightarrow P\{\frac{\sum_{i=1}^{50}(x_i - 9)^2}{\sigma_0{}^2} < \frac{k_3}{\sigma_0{}^2}\} + P\{\frac{\sum_{i=1}^{50}(x_i - 9)^2}{\sigma_0{}^2} > \frac{k_4}{\sigma_0{}^2}\} = .01$$

Since, both are mutually exclusive

Assuming that the test is equitailed we have,

$$P\{\frac{\sum_{i=1}^{50}(x_i - 9)^2}{\sigma_0{}^2} < \frac{k_3}{\sigma_0{}^2}\} = .01/2 = .005 \Rightarrow P\{\chi_{(n)}{}^2 < c\} = .005$$

$$P\{\frac{\sum_{i=1}^{50}(x_i - 9)^2}{\sigma_0{}^2} > \frac{k_4}{\sigma_0{}^2}\} = .01/2 = .005 \Rightarrow P\{\chi_{(n)}{}^2 > d\} = .005 \Rightarrow P\{\chi_{(n)}{}^2 < d\} = .995$$

To calculate the value of c and d,we use the following R-command :

c = qchisq(0.005,50,0)

var = 6

k3 = var*c

d = qchisq(0.995,50,0)

var = 6

k4 = var*d

$\therefore k_3 = 167.9445$

$k_4 = 476.9399$

Thus the C.R. is given by,

$W_3 = \{ \underset{\sim}{x} : \sum_{i=1}^{50} (x_i - 9)^2 < 167.9445 \text{ or } \sum_{i=1}^{50} (x_i - 9)^2 > 476.9399 \}$

Now, the Power of the test is given by,

$\text{Power} = P(x \in W_3 \mid H_1)$

$$= P\{\underset{\sim}{x} : \sum_{i=1}^{50} (x_i - 9)^2 < 167.9445 \text{ or } \sum_{i=1}^{50} (x_i - 9)^2 > 476.9399 \mid H_1 \}$$

$$= P\{\frac{\sum_{i=1}^{50} \left(x_i - 9\right)^2}{\sigma_1{}^2} < \frac{167.9445}{\sigma_1{}^2}\} + P\{\frac{\sum_{i=1}^{50} (x_i - 9)^2}{\sigma_1{}^2} > \frac{476.9399}{\sigma_1{}^2}\}$$

$$= P\{\chi_{(n)}{}^2 < \frac{167.9445}{\sigma_1{}^2}\} + [1 - P\{\chi_{(n)}{}^2 < \frac{476.9399}{\sigma_1{}^2}\}]$$

Now to trace the power curve we consider different trial values of $\sigma_1{}^2 \neq 6$ and construct the following table using R-Programming.

Programming in R for case 3

```
c = qchisq(0.005,50,0)

d = qchisq(0.995,50,0)

var = 6

k3 = var*c

k4 = var*d

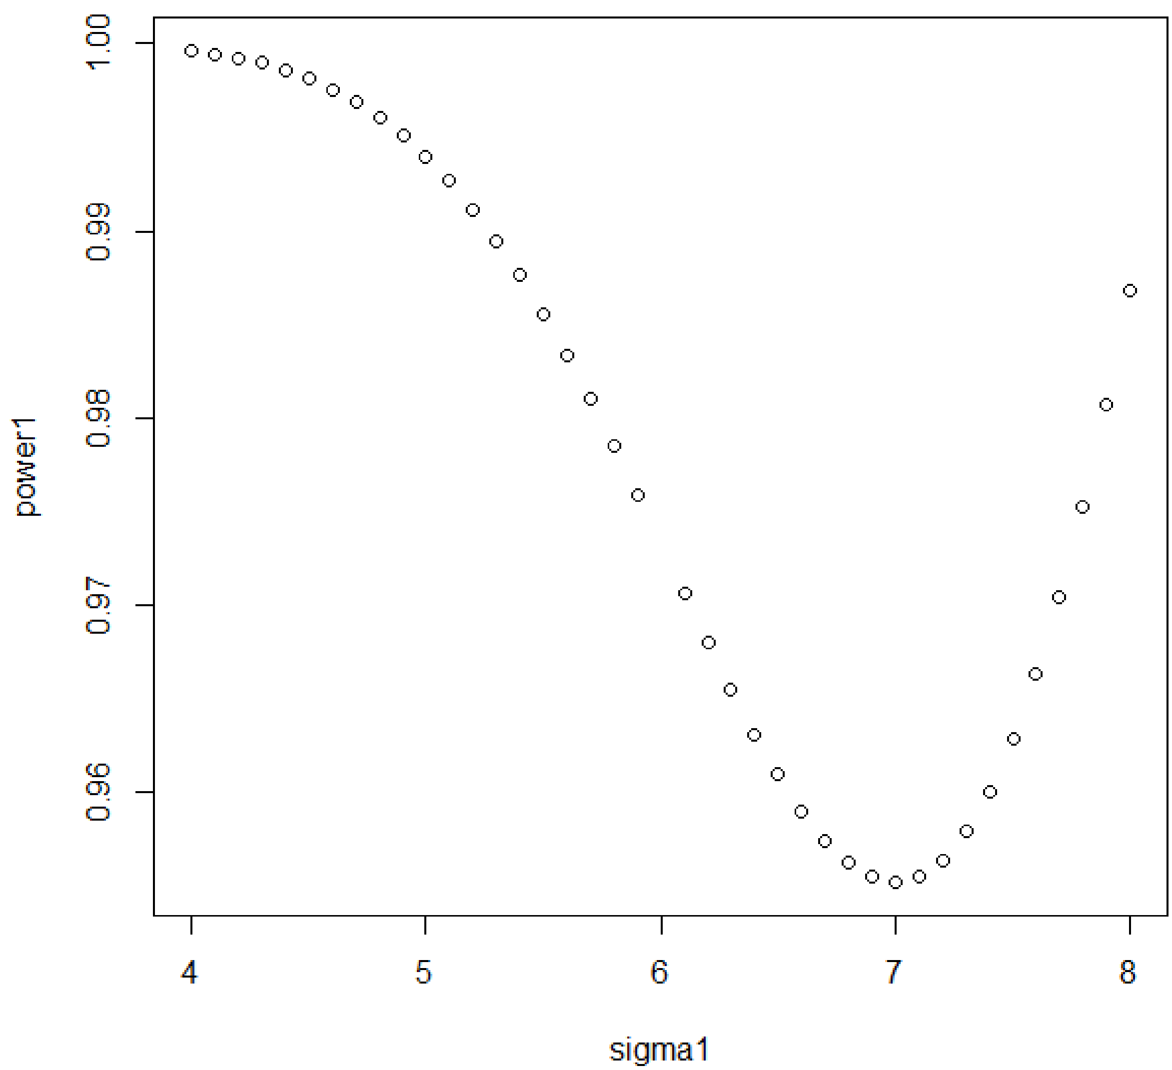
power curve for case 3



Conclusion-

Thus we get three different power curves for testing $H_0 : \sigma^2 = 6$ against

i) H_1: $\sigma^2 > 6$,ii) H_1: $\sigma^2 < 6$ and iii) H_1: $\sigma^2 \neq 6$ respectively at the level of significance $\alpha = 0.01$

.
